

Spatial light modulator incident polarized light

The study of phase modulation from the transmissive twisted nematic liquid crystal spatial light modulator (TN-LCSLM) with different incident states of polarization on its active area using ...

A spatial light modulator (SLM) is a device that can control the intensity, phase, or polarization of light in a spatially varying manner. A simple example is an overhead projector transparency. Usually when ...

Spatial Light Modulators (SLMs) are quasiplanar devices, allowing for the modulation of the amplitude, phase and polarization, or a combination of these parameters of an incident light...

We demonstrate polarization-independent phase modulation through beam steering tests under various input polarizations, achieving high optical efficiency and low polarization-dependent ...

We experimentally demonstrate polarization-insensitive spatial light modulations for incident linearly polarized beams with different polarization states and polarization-multiplexed beams.

Abstract: A fast and automated scheme for general polarization transformations holds great value in adaptive optics, quantum information, and virtually all applications involving light-matter and light ...

Preliminary polarization crosstalk results: Any light incident to the SLM must be linearly polarized to be actuated, with its polarization axis aligned with the SLM's polarization axis.

Spatial light modulators are versatile devices employed in a vast range of applications to modify the transverse phase or amplitude profile of an incident light beam. Most experiments are ...

Spatial phase control or modulation is accomplished without altering the intensity profile of an incident beam. Light linearly polarized parallel to the extraordinary axis of the LC material is phase modulated ...

Spatial light modulators (SLMs) are two-dimensional objects, enabling to modulate, at any point of the SLM surface, through a local change of the optical path, the in-tensity, phase or polarization of an ...
