

Two beam splitters

A beam splitter is an optical device that splits beams (such as laser beams) into two (or more) beams. Beam splitters typically come in the form of a reflective device that can split beams into exactly ...

Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. Additionally, beamsplitters can be used in reverse to combine two different beams into a ...

Optical beam splitters are important components across multiple optical systems since they serve applications throughout telecommunications and scientific research. These devices split ...

A beam splitter is an optical component used for splitting light into two separate beams, usually by wavelength or polarity. It can also be used, in reverse, as a beam combiner, to join two light beams ...

Thorlabs offers a wide range of optical beamsplitters. Our plate beamsplitters have a coated front surface that determines the beam splitting ratio while the back surface is wedged and AR coated in ...

Beam splitters are also key in interferometry. They separate a single beam into two parts, with one reflecting off of a surface. By merging the reflected light with the first beam, distance...

In its most common form, a cube, a beam splitter is made from two triangular glass prisms which are glued together at their base using polyester, epoxy, or urethane-based adhesives.

Beam splitters are a fundamental element in optical systems. Beam splitters are, in essence, optical components used to divide a single light source (usually a laser) into two separate ...

Find the right beam splitters for your next project. Explore various beam splitter types, properties, and applications

Beamsplitters are usually made as a reflective device that splits the beam into exactly 50/50 with half of the beam being transmitted and the other half being reflected. If this component is ...
