

Vertical displacement type optical attenuator models

An optical attenuator, or fiber optic attenuator, is a device used to reduce the power level of an optical signal, either in free space or in an optical fiber. The basic types of optical attenuators are fixed, step ...

An optical attenuator is a device used to reduce the optical power of a light beam. The amount of attenuation is often specified in decibels or as an optical density.

The MEMS attenuator design achieves highly repeatable optical attenuation over C and/or L bands through a thermally-actuated reflective vane that intercepts light.

We produce a wide range of fiber optical attenuators for all application scenarios.

These best-in-class attenuators are available either as single units or as arrays of attenuators in which each VOA has its own independent continuous control. Attenuation is controlled by an analog DC ...

This letter presents the design, simulation, fabrication, and successful demonstration of a variable optical attenuator (VOA) based on a micromachined micromirror combined with an optical ...

This type of fiber optic attenuator is ideal for multimode fiber applications because the neutral density filter attenuates all modes equally, and results in stable attenuation and linear response.

In this paper, a three-dimensional (3D) polymer variable optical attenuator (VOA) is proposed. For monolithic integration of silica and polymer-based planar lightwave circuits (PLCs), the ...

The Bench Top Variable Optical Attenuator series is a highly-reliable, compact attenuator that provides fast, repeatable, settings over a wide attenuation range manually or remotely. This general purpose ...
